## Transposed lines

The potential coefficients matrix

$$
\left(\delta_{\mathrm{km}}\right)=\frac{1}{3}\left\{\left(\begin{array}{lll}

\delta_{23} & \delta_{33} & \delta_{13} \\
\delta_{12} & \delta_{13} & \delta_{11}
\end{array}\right)\right\}
$$

Let's introduce

$$
\begin{aligned}
\delta= & \frac{1}{3}\left(\delta_{11}+\delta_{22}+\delta_{33}\right) \\
\delta= & \frac{1}{0,0242} \log \frac{2 \mathrm{~h}}{\mathrm{r}}(\mathrm{~km} / \mu \mathrm{F}) \\
& \text { mean geometrical height } \\
& \mathrm{h}=\sqrt[3]{\mathrm{h}_{1} \mathrm{~h}_{2} \mathrm{~h}_{3}}
\end{aligned}
$$

$$
\begin{aligned}
& \delta^{\prime}=\frac{1}{3}\left(\delta_{12}+\delta_{13}+\delta_{23}\right) \\
& \delta^{\prime}=\frac{1}{0,0242} \log \frac{\sqrt{4 h^{2}+\mathrm{d}^{2}}}{\mathrm{~d}}(\mathrm{~km} / \mu \mathrm{F}) \\
& d=\sqrt[3]{\mathrm{d}_{12} \mathrm{~d}_{13} \mathrm{~d}_{23}}
\end{aligned}
$$

Then

$$
\left(\begin{array}{l}
\hat{\mathrm{U}}_{\mathrm{a}} \\
\hat{\mathrm{U}}_{\mathrm{b}} \\
\hat{\mathrm{U}}_{\mathrm{c}}
\end{array}\right)=\left(\begin{array}{ccc}

$$

For the charges

$$
\left(\begin{array}{c}
\hat{\mathrm{Q}}_{\mathrm{a}} \\
\hat{\mathrm{Q}}_{\mathrm{b}} \\
\hat{\mathrm{Q}}_{\mathrm{c}}
\end{array}\right)=\left(\begin{array}{ccc}
\mathrm{k}_{0}+2 \mathrm{k}^{\prime} & -\mathrm{k}^{\prime} & -\mathrm{k}^{\prime} \\
-\mathrm{k}^{\prime} & \mathrm{k}_{0}+2 \mathrm{k}^{\prime} & -\mathrm{k}^{\prime} \\
-\mathrm{k}^{\prime} & -\mathrm{k}^{\prime} & \mathrm{k}_{0}+2 \mathrm{k}^{\prime}
\end{array}\right)\left(\begin{array}{c}
\hat{\mathrm{U}}_{\mathrm{a}} \\
\hat{\mathrm{U}}_{\mathrm{b}} \\
\hat{\mathrm{U}}_{\mathrm{c}}
\end{array}\right)
$$

Solution:

$$
\mathrm{k}_{0}=\frac{1}{\delta+2 \delta^{\prime}}
$$

Capacity between conductors

$$
\mathrm{k}^{\prime}=\frac{\delta^{\prime}}{\left(\delta+2 \delta^{\prime}\right) \cdot\left(\delta-\delta^{\prime}\right)}
$$

Operational capacity (real number)

$$
\mathrm{C}=\mathrm{C}_{\mathrm{a}}=\mathrm{C}_{\mathrm{b}}=\mathrm{C}_{\mathrm{c}}=\mathrm{k}_{0}+3 \mathrm{k}^{\prime}
$$

$$
\mathrm{C}=\frac{1}{\delta-\delta^{\prime}}
$$

$$
\mathrm{C}=\frac{0,0242}{\log \frac{2 \mathrm{hd}}{\mathrm{r} \sqrt{4 \mathrm{~h}^{2}+\mathrm{d}^{2}}}}(\mu \mathrm{~F} / \mathrm{km})
$$

Influence of ground wires: $\quad \mathrm{k}_{0}$ increase, $\mathrm{k}^{\prime}$ decrease, C no change Influence of metal towers: $\quad k_{0}$ increase (by 3-6\%)

Values:

- $400 \mathrm{kV} \mathrm{-} \mathrm{~B}_{1} \approx(3,5 \div 4,5) \mu \mathrm{S} \cdot \mathrm{km}^{-1}$
- $110,220 \mathrm{kV}-\mathrm{B}_{1} \approx(2,5 \div 3) \mu \mathrm{S} \cdot \mathrm{km}^{-1}$
- $22 \mathrm{kV}-\mathrm{B}_{1} \approx 1,4 \mu \mathrm{~S} \cdot \mathrm{~km}^{-1}$

Conductance is negligible in relation to capacities.
