## VOLTAGE DROPS IN POWER SYSTEM

## Simple DC line (LV, MV)

Double-wire circuit. Assumption: constant cross-section and resistivity. El. traction, electrochemistry, light sources, long-distance transmission, power electronics.

Single loads supplied from one side

a) addition method

It adds voltage drops along the power line sections. (Voltage drops are always in both conductors in the section.)
$k^{\text {th }}$ section

$$
\mathrm{U}_{(\mathrm{k}-1)}-\mathrm{U}_{\mathrm{k}}=\Delta \mathrm{U}_{(\mathrm{k}-1) \mathrm{k}}=2 \frac{\rho}{\mathrm{~S}}\left(\mathrm{l}_{\mathrm{k}}-\mathrm{l}_{(\mathrm{k}-1)}\right) \cdot \mathrm{I}_{(\mathrm{k}-1) \mathrm{k}} \quad\left(\mathrm{~V} ; \Omega \mathrm{m}, \mathrm{~m}^{2}, \mathrm{~m}, \mathrm{~A}\right)
$$

Current in $k^{\text {th }}$ section

$$
I_{(k-1) k}=\sum_{y=k}^{n} I_{y}
$$

Maximum voltage drop

$$
\Delta \mathrm{U}_{\mathrm{n}}=\sum_{\mathrm{k}=1}^{\mathrm{n}} \Delta \mathrm{U}_{(\mathrm{k}-1) \mathrm{k}}=2 \frac{\rho}{\mathrm{~S}} \sum_{\mathrm{k}=1}^{\mathrm{n}}\left(\mathrm{l}_{\mathrm{k}}-\mathrm{l}_{(\mathrm{k}-1)}\right) \cdot \sum_{\mathrm{y}=\mathrm{k}}^{\mathrm{n}} \mathrm{I}_{\mathrm{y}}
$$

b) superposition method

It adds voltage drops for individual discrete loads:

$$
\Delta \mathrm{U}_{\mathrm{n}}=2 \frac{\rho}{\mathrm{~S}} \sum_{\mathrm{k}=1}^{\mathrm{n}} 1_{\mathrm{k}} \mathrm{I}_{\mathrm{k}}
$$

$1_{k} I_{k} \ldots$ current moments to the feeder
Relative voltage drop:

$$
\varepsilon=\frac{\Delta \mathrm{U}}{\mathrm{U}_{\mathrm{n}}}(-; \mathrm{V}, \mathrm{~V})
$$

Note. Losses must be calculated only by means of the addition method!

$$
\begin{aligned}
& \Delta \mathrm{P}_{(\mathrm{k}-1) \mathrm{k}}=2 \frac{\rho}{\mathrm{~S}}\left(\mathrm{l}_{\mathrm{k}}-\mathrm{l}_{(\mathrm{k}-1)}\right) \cdot \mathrm{I}_{(\mathrm{k}-1) \mathrm{k}}^{2} \quad\left(\mathrm{~W} ; \Omega \mathrm{m}, \mathrm{~m}^{2}, \mathrm{~m}, \mathrm{~A}\right) \\
& \Delta \mathrm{P}=\sum_{\mathrm{k}=1}^{\mathrm{n}} \Delta \mathrm{P}_{(\mathrm{k}-1) \mathrm{k}}
\end{aligned}
$$

$\underline{\text { Single loads supplied from both sides - the same feeders voltages }}$

- Ring grid, higher reliability of supply.
- Two one-feeder lines after a fault.
- Calculation of current distribution and voltage drops.

Consider $\mathrm{I}_{\mathrm{B}}$ as a negative load:

$$
\Delta \mathrm{U}_{\mathrm{AB}}=\mathrm{U}_{\mathrm{A}}-\mathrm{U}_{\mathrm{B}}=0=2 \frac{\rho}{\mathrm{~S}} \sum_{\mathrm{k}=1}^{\mathrm{n}} 1_{\mathrm{k}} \mathrm{I}_{\mathrm{k}}-2 \frac{\rho}{\mathrm{~S}} \mathrm{II}_{\mathrm{B}}
$$

Hence (moment theorem)

$$
\mathrm{I}_{\mathrm{B}}=\frac{\sum_{\mathrm{k}=1}^{\mathrm{n}} 1_{\mathrm{k}} \mathrm{I}_{\mathrm{k}}}{1}
$$

Analogous (current moments to other feeder)

$$
\mathrm{I}_{\mathrm{A}}=\frac{\sum_{\mathrm{k}=1}^{\mathrm{n}}\left(1-\mathrm{l}_{\mathrm{k}}\right) \mathrm{I}_{\mathrm{k}}}{1}
$$

Of course

$$
\mathrm{I}_{\mathrm{A}}+\mathrm{I}_{\mathrm{B}}=\sum_{\mathrm{y}=1}^{\mathrm{n}} \mathrm{I}_{\mathrm{y}}
$$

Current distribution identifies the place with the biggest voltage drop $=$ the place with feeder division $\rightarrow$ split-up into two one-feeder lines.

Single loads supplied from both sides - different feeders voltages
Two different sources, meshed grid.

Superposition:

1) Current distribution with the same voltages.
2) Different voltages and zero loads $\rightarrow$ balancing current

$$
\mathrm{I}_{\mathrm{v}}=\frac{\mathrm{U}_{\mathrm{A}}-\mathrm{U}_{\mathrm{B}}}{2 \frac{\rho}{\mathrm{~S}} 1}
$$

3) Sum of the solutions $1+2$

Further calculation is the same.
Or directly:

$$
\begin{aligned}
& \mathrm{U}_{\mathrm{A}}-\mathrm{U}_{\mathrm{B}}=2 \frac{\rho}{\mathrm{~S}} \sum_{\mathrm{k}=1}^{\mathrm{n}} 1_{\mathrm{k}} \mathrm{I}_{\mathrm{k}}-2 \frac{\rho}{\mathrm{~S}} 1 \mathrm{I}_{\mathrm{B}} \\
& \mathrm{I}_{\mathrm{B}}=\frac{2 \frac{\rho}{\mathrm{~S}} \sum_{\mathrm{k}=1}^{\mathrm{n}} 1_{\mathrm{k}} \mathrm{I}_{\mathrm{k}}}{2 \frac{\rho}{\mathrm{~S}} 1}-\frac{\mathrm{U}_{\mathrm{A}}-\mathrm{U}_{\mathrm{B}}}{2 \frac{\rho}{\mathrm{~S}} 1}
\end{aligned}
$$

## Direct current transmission HV

Long distance transmission or local stations (AC-DC-AC).
Reasons: transmission stability, short-circuit conditions, parameters compensation, power losses, economic aspects, power systems connection.

Possibility of smaller insulation distances and higher transmission capacity than for AC systems.
Control by DC voltage.
Principle

Configurations:

a) Ground as return conductor. Ground resistance does not depend on line length but on ground connection. Suitable for unoccupied regions (corrosion, EMC).
b) Two wires line. Compared to 3ph less material, lighter towers.
c) Two convertors in series. Low balancing ground current caused by unbalance. During a fault it transforms to a), half power.

450 kV DC Canada

## Complex power in AC grids

3 phase

$$
\begin{aligned}
& \mathrm{P}=3 \mathrm{U}_{\mathrm{f}} \mathrm{I} \cos \varphi=\sqrt{3} \mathrm{UI} \cos \varphi \quad(\mathrm{~W}) \\
& \mathrm{Q}=3 \mathrm{U}_{\mathrm{f}} \mathrm{I} \sin \varphi=\sqrt{3} \mathrm{UI} \sin \varphi \quad(\mathrm{VAr}) \\
& \mathrm{S}=3 \mathrm{U}_{\mathrm{f}} \mathrm{I}=\sqrt{3} \mathrm{UI}=\sqrt{\mathrm{P}^{2}+\mathrm{Q}^{2}} \quad(\mathrm{VA})
\end{aligned}
$$

Complex (1 phase)

$$
\hat{\mathrm{S}}_{\mathrm{f}}=\mathrm{P}_{\mathrm{f}} \pm \mathrm{j} \mathrm{Q}_{\mathrm{f}}=\mathrm{U}_{\mathrm{f}} \mathrm{I}(\cos \varphi \pm \mathrm{j} \sin \varphi)=\mathrm{S}_{\mathrm{f}} \mathrm{e}^{ \pm \mathrm{j} \mathrm{\varphi}}
$$

Sign according a convention.
Inductive load

$$
\hat{U}_{f}=U_{f} e^{j \varphi_{u}}, \hat{I}_{f}=I e^{j \varphi_{i}}
$$

Complex conjugated current

$$
\begin{aligned}
& \hat{\mathrm{S}}_{\mathrm{f}}=\hat{\mathrm{U}}_{\mathrm{f}} \hat{\mathrm{I}}^{*}=\mathrm{U}_{\mathrm{f}} \mathrm{Ie}^{\mathrm{j}\left(\varphi_{\mathrm{u}}-\varphi_{\mathrm{i}}\right)}=\mathrm{U}_{\mathrm{f}} \mathrm{Ie}^{\mathrm{j} \varphi} \\
& \hat{\mathrm{~S}}_{\mathrm{f}}=\hat{\mathrm{U}}_{\mathrm{f}} \hat{I}^{*}=\mathrm{P}_{\mathrm{f}} \pm \mathrm{j} \mathrm{Q}_{\mathrm{f}} \mathrm{CAD}
\end{aligned}
$$

## 3 phase power lines LV, MV

Series parameters are applied, for LV X $\rightarrow 0$.
3 phase power line MV, 1 load at the end
Symmetrical load $\rightarrow 1$ phase diagram, operational parameters.

Complex voltage drop

$$
\begin{gathered}
\Delta \hat{\mathrm{U}}_{\mathrm{f}}=\hat{\mathrm{Z}}_{\mathrm{l}} \hat{\mathrm{I}}=(\mathrm{R}+\mathrm{jX})\left(\mathrm{I}_{\check{\mathrm{c}}} \mp \mathrm{jI}_{\mathrm{j}}\right)_{\mathrm{CAP}}^{\mathrm{IND}} \\
\Delta \hat{\mathrm{U}}_{\mathrm{f}}= \\
=\mathrm{RI}_{\check{\mathrm{c}}} \pm \mathrm{XI}_{\mathrm{j}}+\mathrm{j}\left(\mathrm{XI}_{\check{\mathrm{c}}} \mp \mathrm{RI}_{\mathrm{j}}\right)_{\mathrm{IND}}^{\mathrm{IND}} \\
\text { magnitude phase }
\end{gathered}
$$

Phasor diagram (input $\mathrm{U}_{\mathrm{f} 2}, \mathrm{I}, \varphi_{2}$ ) (angle $v$ usually small, up to $3^{\circ}$ )
Imagin. part neglecting and modifications

$$
\Delta \mathrm{U}_{\mathrm{f}}=\frac{\mathrm{R} 3 \mathrm{U}_{\mathrm{f}} \mathrm{I}_{\tilde{\mathrm{c}}} \pm \mathrm{X} 3 \mathrm{U}_{\mathrm{f}} \mathrm{I}_{\mathrm{j}}}{3 \mathrm{U}_{\mathrm{f}}}=\frac{\mathrm{RP} \pm \mathrm{XQ}}{3 \mathrm{U}_{\mathrm{f}}}
$$

Percentage voltage drop

$$
\varepsilon=\frac{\Delta \mathrm{U}_{\mathrm{f}}}{\mathrm{U}_{\mathrm{f}}}=\frac{\mathrm{RP} \pm \mathrm{XQ}}{3 \mathrm{U}_{\mathrm{f}}^{2}}=\frac{\mathrm{RP} \pm \mathrm{XQ}}{\mathrm{U}^{2}}
$$

3 phase active power losses

$$
\begin{aligned}
\Delta \hat{\mathrm{S}} & =3 \Delta \hat{\mathrm{U}}_{\mathrm{f}} \hat{\mathrm{I}}^{*}=3 \hat{\mathrm{Z}}_{\mathrm{I}} \hat{\mathrm{I}}^{\cdot} \cdot \hat{\mathrm{I}}^{*}=3 \hat{\mathrm{Z}}_{\mathrm{I}} \mathrm{I}^{2}= \\
& =3(\mathrm{R}+\mathrm{jX}) \mathrm{I}^{2}=3 \mathrm{II}^{2}+\mathrm{j} 3 \mathrm{XI}^{2} \\
\Delta \mathrm{P} & =3 \mathrm{RI}^{2}=3 \mathrm{R}\left(\mathrm{I}_{\stackrel{\mathrm{c}}{2}}^{2}+\mathrm{I}_{\mathrm{j}}^{2}\right) \quad(\mathrm{W} ; \Omega, \mathrm{A})
\end{aligned}
$$

! Even the reactive current causes active power losses!
$\rightarrow$ reactive power compensation

## 3 phase MV power line supplied from one side

Constant series impedance

$$
\hat{Z}_{1_{1}}=\mathrm{R}_{1}+\mathrm{j} \mathrm{X}_{1} \quad(\Omega / \mathrm{km})
$$

Voltage drop at the end (needn't be the highest one, it depends on load character)

$$
\Delta \hat{\mathrm{U}}_{\mathrm{fAn}}=\hat{\mathrm{Z}}_{\mathrm{l}_{1}} \sum_{\mathrm{k}=1}^{\mathrm{n}} 1_{\mathrm{k}} \hat{\mathrm{I}}_{\mathrm{k}}
$$

After imaginary part neglecting

$$
\begin{aligned}
& \Delta \mathrm{U}_{\mathrm{fAn}} \doteq \mathrm{R}_{1} \sum_{\mathrm{k}=1}^{\mathrm{n}} 1_{\mathrm{k}} \mathrm{I}_{\mathrm{ck}} \pm \mathrm{X}_{1} \sum_{\mathrm{k}=1}^{\mathrm{n}} 1_{\mathrm{k}} \mathrm{I}_{\mathrm{jk}} \mathrm{IND} \\
& \Delta \mathrm{U}_{\mathrm{fAn}} \doteq \frac{\mathrm{R}_{1} \sum_{\mathrm{k}=1}^{\mathrm{n}} 1_{\mathrm{k}} \mathrm{P}_{\mathrm{k}} \pm \mathrm{X}_{1} \sum_{\mathrm{k}=1}^{\mathrm{n}} 1_{\mathrm{k}} \mathrm{Q}_{\mathrm{k}} \mathrm{IND}}{3 \mathrm{U}_{\mathrm{f}}} \mathrm{CAP}
\end{aligned}
$$

Voltage drop up to the point X (superposition)

$$
\Delta \hat{\mathrm{U}}_{\mathrm{fAX}}=\hat{\mathrm{Z}}_{\mathrm{l}_{1}} \sum_{\mathrm{k}=1}^{\mathrm{X}} 1_{\mathrm{k}} \hat{\mathrm{I}}_{\mathrm{k}}+\hat{\mathrm{Z}}_{\mathrm{l}_{1}} 1_{\mathrm{AX}} \sum_{\mathrm{k}=\mathrm{X}+1}^{\mathrm{n}} \hat{\mathrm{I}}_{\mathrm{k}}
$$

## 3 phase MV power line supplied from both sides

Calculation as for DC line (feeder is a negative load, zero voltage drop).

$$
\Delta \hat{\mathrm{U}}_{\mathrm{AB}}=0=\hat{\mathrm{Z}}_{\mathrm{l}_{1}} \sum_{\mathrm{k}=1}^{\mathrm{n}} 1_{\mathrm{k}} \hat{\mathrm{I}}_{\mathrm{k}}-\hat{\mathrm{Z}}_{\mathrm{I}_{1}} 1 \cdot \hat{\mathrm{I}}_{\mathrm{B}}
$$

Moment theorems

$$
\hat{\mathrm{I}}_{\mathrm{B}}=\frac{\sum_{\mathrm{k}=1}^{\mathrm{n}} 1_{\mathrm{k}} \hat{\mathrm{I}}_{\mathrm{k}}}{1} \quad \hat{\mathrm{I}}_{\mathrm{A}}=\frac{\sum_{\mathrm{k}=1}^{\mathrm{n}}\left(1-1_{\mathrm{k}}\right) \hat{\mathrm{I}}_{\mathrm{k}}}{1} \quad \hat{\mathrm{I}}_{\mathrm{A}}+\hat{\mathrm{I}}_{\mathrm{B}}=\sum_{\mathrm{y}=1}^{\mathrm{n}} \hat{\mathrm{I}}_{\mathrm{y}}
$$

(In principle it is the current divider for each load.)
Active and reactive current sign change could be in different nodes $\rightarrow$ maximum voltage drop should be checked in all grid points.

## Meshed grids MV

NO!

|  |
| :---: |
|  |  |

## Node voltage method

Grid with $n$ nodes. Set series branch parameters $\hat{Z}_{\mathrm{km}}$, load currents (nodal currents) $\hat{\mathrm{I}}_{\mathrm{k}}$, min. 1 node voltage $\hat{\mathrm{U}}_{\mathrm{fk}}$ (between the node and the ground).

Calculation with series admittances

$$
\hat{\mathrm{Y}}_{\mathrm{km}}=\hat{\mathrm{Z}}_{\mathrm{km}}^{-1}=\frac{1}{\mathrm{R}_{\mathrm{km}}+\mathrm{j} X_{\mathrm{km}}}
$$

Node $k$

$$
\begin{aligned}
& \hat{\mathrm{I}}_{\mathrm{k}}+\sum_{\substack{\mathrm{m}=1 \\
\mathrm{~m} \neq \mathrm{k}}}^{\mathrm{n}} \hat{\mathrm{I}}_{\mathrm{km}}+\hat{\mathrm{I}}_{\mathrm{k} 0}=0 \\
& \hat{\mathrm{I}}_{\mathrm{k} 0}=\hat{\mathrm{U}}_{\mathrm{fk}} \hat{\mathrm{Y}}_{\mathrm{k} 0}
\end{aligned}
$$

Branches $k, m$

$$
\hat{\mathrm{I}}_{\mathrm{km}}=\left(\hat{\mathrm{U}}_{\mathrm{fk}}-\hat{\mathrm{U}}_{\mathrm{fm}}\right) \hat{\mathrm{Y}}_{\mathrm{km}}
$$

After modifications:

$$
\hat{\mathrm{I}}_{\mathrm{k}}=-\sum_{\substack{\mathrm{m}=1 \\ \mathrm{~m} \neq \mathrm{k}}}^{\mathrm{n}}\left(\hat{\mathrm{U}}_{\mathrm{fk}}-\hat{\mathrm{U}}_{\mathrm{fm}}\right) \hat{\mathrm{Y}}_{\mathrm{km}}-\hat{\mathrm{U}}_{\mathrm{fk}} \hat{\mathrm{Y}}_{\mathrm{k} 0}
$$

$$
\hat{I}_{\mathrm{k}}=-\hat{U}_{\mathrm{fk}}\left(\sum_{\substack{\mathrm{m}=\mathrm{Y} \\ \mathrm{~m} \neq \mathrm{k}}}^{\mathrm{n}} \hat{Y}_{\mathrm{km}}+\hat{Y}_{\mathrm{k} 0}\right)+\sum_{\substack{\mathrm{m}=1 \\ \mathrm{~m} \neq \mathrm{k}}}^{\mathrm{n}} \hat{\mathrm{U}}_{\mathrm{fm}} \hat{Y}_{\mathrm{km}}
$$

Admittance matrix parameters definition:
Nodal self-admittance (diagonal element)

$$
\hat{\mathrm{Y}}_{(\mathrm{k}, \mathrm{k})}=-\sum_{\substack{\mathrm{m}=1 \\ \mathrm{~m} \neq \mathrm{k}}}^{\mathrm{n}} \hat{\mathrm{Y}}_{\mathrm{km}}-\hat{\mathrm{Y}}_{\mathrm{k} 0}
$$

Between nodes admittance (non-diagonal element)

$$
\begin{aligned}
& \hat{\mathrm{Y}}_{(\mathrm{k}, \mathrm{~m})}=\hat{\mathrm{Y}}_{(\mathrm{m}, \mathrm{k})}=\hat{\mathrm{Y}}_{\mathrm{km}} \text { for } \mathrm{m} \neq \mathrm{k} \\
& \text { (for non-connected nodes } \hat{\mathrm{Y}}_{(\mathrm{k}, \mathrm{~m})}=0 \text { ) }
\end{aligned}
$$

Hence

$$
\hat{\mathrm{I}}_{\mathrm{k}}=\sum_{\mathrm{m}=1}^{\mathrm{n}} \hat{\mathrm{Y}}_{(\mathrm{k}, \mathrm{~m})} \hat{\mathrm{U}}_{\mathrm{fm}}
$$

Matrix form

$$
(\hat{I})=(\hat{\mathrm{Y}})\left(\hat{\mathrm{U}}_{f}\right)
$$

Set voltages at nodes 1 to $k(x)$, currents at nodes $k+1$ to $n(y)$

$$
\binom{\left(\hat{\mathrm{I}}_{\mathrm{x}}\right)}{\hat{\mathrm{I}}_{\mathrm{y}}}=\left(\begin{array}{cc}
\left(\hat{\mathrm{Y}}_{\mathrm{xx}}\right) & \left(\hat{\mathrm{Y}}_{\mathrm{xy}}\right. \\
\left(\hat{\mathrm{Y}}_{\mathrm{xy}}\right)^{\mathrm{T}} & \left(\hat{\mathrm{Y}}_{\mathrm{yy}}\right.
\end{array}\right)\binom{\left(\hat{\mathrm{U}}_{\mathrm{fx}}\right)}{\left(\hat{\mathrm{U}}_{\mathrm{fy}}\right.}
$$

Hence

$$
\begin{aligned}
& \left(\hat{I}_{x}\right)=\left(\hat{Y}_{x x}\right)\left(\hat{U}_{f x}\right)+\left(\hat{Y}_{x y}\right)\left(\hat{U}_{f y}\right) \\
& \left(\hat{I}_{y}\right)=\left(\hat{Y}_{x y}\right)^{T}\left(\hat{U}_{f x}\right)+\left(\hat{Y}_{y y}\right)\left(\hat{U}_{f y}\right)
\end{aligned}
$$

Calculate $\left(\hat{I}_{x}\right),\left(\hat{U}_{f y}\right)$

$$
\left(\hat{\mathrm{U}}_{\mathrm{fy}}\right)=\left(\hat{\mathrm{Y}}_{\mathrm{yy}}\right)^{-1}\left(\hat{\mathrm{I}}_{\mathrm{y}}\right)-\left(\hat{\mathrm{Y}}_{\mathrm{yy}}\right)^{-1}\left(\hat{\mathrm{Y}}_{\mathrm{xy}}\right)^{\mathrm{T}}\left(\hat{\mathrm{U}}_{\mathrm{fx}}\right)
$$

If some nodes are connected to the ground (through an admittance), then the admittance matrix is regular $\rightarrow$ to set all nodal current is enough.

$$
\left(\hat{\mathrm{U}}_{\mathrm{f}}\right)=(\hat{\mathrm{Y}})^{-1}(\hat{\mathrm{I}})
$$

Note 1: Similar for DC grid.

$$
(\mathrm{I})=(\mathrm{G})(\mathrm{U})
$$

Note 2: For power engineering - powers are set, currents are calculated from the powers.

$$
\hat{\mathrm{I}}=\left(\frac{\hat{\mathrm{S}}}{\sqrt{3} \hat{\mathrm{U}}}\right)^{*}
$$

Results are not precise if nominal voltages are used $\rightarrow$ iteration methods.
